TL;DR:

- **We should use Docker image v0.02.**
  - **V0.01 is missing one change possibly relevant to this project that is included in v0.02.**
- **We should continue to pursue getting Dockerfile to create image natively.**

Two docker images available from qwiklabs:
- us-docker.pkg.dev/qwiklabs-resources/healthcare-qwiklabs-resources/dataflow-pipeline:v0.01
- us-docker.pkg.dev/qwiklabs-resources/healthcare-qwiklabs-resources/dataflow-pipeline:v0.02

Docker command used to determine when an image was created:
    docker history --format "{{.ID}}: {{.CreatedAt}}" {IMAGE ID}
The two docker images were created 1 year apart:

v0.01	04/26/2021 T10:40-06:00
V0.02	04/28/2022 T10:28-06:00

Figure below shows git commit tree from 4/26/2021 (v0.01) to today.
- Red box: commit probably used to create v0.01
- Purple box: commit probably used to create v0.02
- Red arrow: commit that has changes possibly relevant to CapsuleTech project
- NOTE: Only 1 commit after v0.02 for custom runner, not related to CapsuleTech project
